
2018 Latest Design 6v Dc Brushless Motor Gearbox - Closed loop motor driver-HBS57 - Longs Motor

Features:

- Closed-loop, eliminates loss of synchronization
- Broader operating range ? higher torque and higher speed
- Reduced motor heating and more efficient
- Smooth motion and super-low motor noise
- Do not need a high torque margin
- No Tuning and always stable
- Fast response, no delay and almost no settle time
- High torque at starting and low speed, high stiffness at standstill
- Lower cost

The HBS series offers an alternative for applications requiring high performance and high reliability when the servo was the only choice, while it remains cost-effective. The system includes a 3-phase stepper motor combined with a fully digital, high performance drive and an internal encoder which is used to close the position, velocity and current loops in real time, just like servo systems. It combines the best of servo and stepper motor technologies, and delivers unique capabilities and enhancements over both, while at a fraction of the cost of a servo system.

Applications:

The HBS series offers an alternative for applications requiring high performance and high reliability when the servo was the only choice, while it remains cost-effective. Its great feature of fast response and no hunting make it ideal for applications such as bonding and vision systems in which rapid motions with a short distance are required and hunting would be a problem. And it is ideal for applications where the equipment uses a belt-drive mechanism or otherwise has low rigidity and you don't want it to vibrate when stopping.

Specifications:

General

Electrical Specifications ($T_j = 25^{\circ}\text{C}/77^{\circ}\text{F}$)

Parameters	HBS57			
	Min	Typical	Max	Unit
Output current	0	-	8.0 (Peak)	A
Input voltage	20	36	50	VDC
Logic signal current	7	10	16	mA
Pulse input frequency	0	-	200	kHz
Isolation resistance	500			MΩ

Connector Configuration

The HBS57 has three connectors, connector for control signals connections, connector for encoder feedback and connector for power and motor connections.

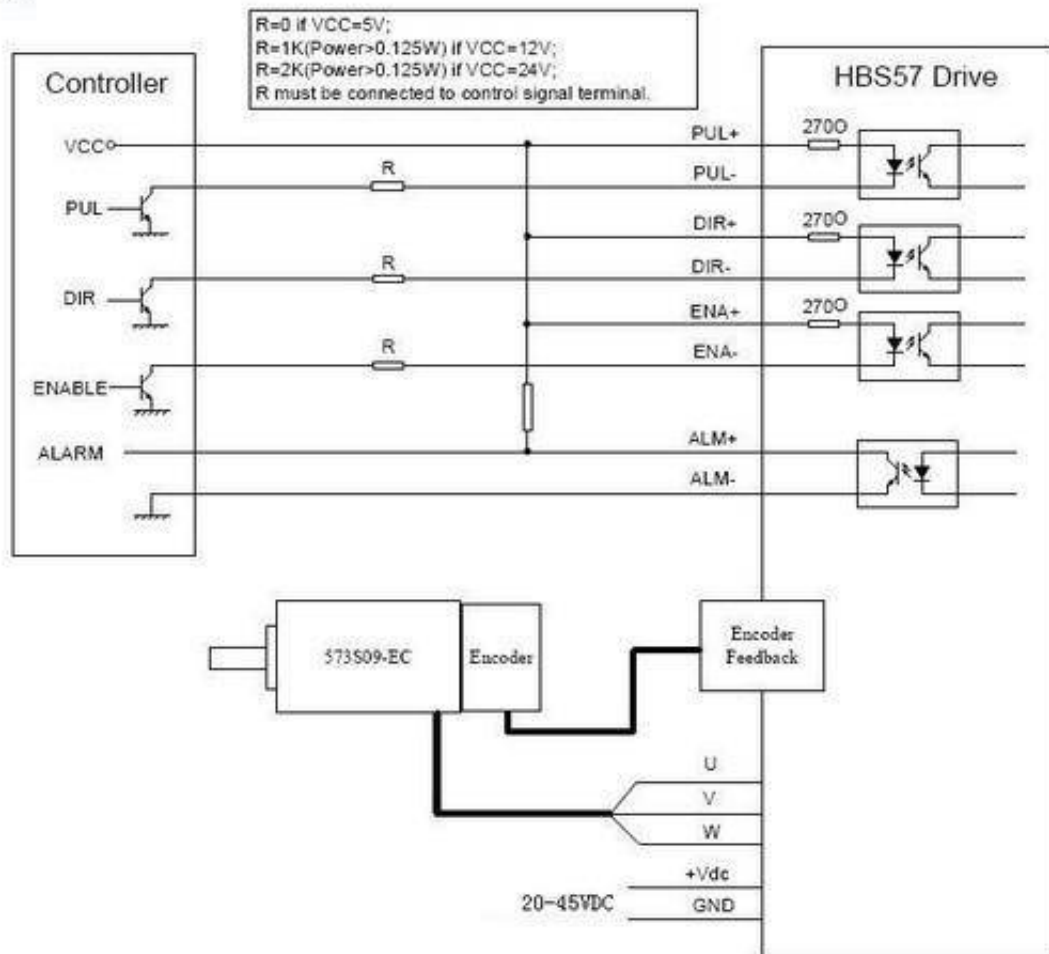

Control Signal Connector - Screw Terminal			
Pin	Name	I/O	Description
1	PUL+	I	<u>Pulse signal</u> : In single pulse (pulse/direction) mode, this input represents pulse signal, each rising or falling edge active (software configurable, see hybrid servo software operational manual for more detail); In double pulse mode (software configurable), this input represents clockwise (CW) pulse, active both at high level and low level. 4-5V when PUL-HIGH, 0-0.5V when PUL-LOW. For reliable response, pulse width should be longer than 10μs. Series connect resistors for current-limiting when +12V or +24V used. The same as DIR and ENA signal.
2	PUL-	I	
3	DIR+	I	<u>Direction Signal</u> : In single-pulse mode, this signal has low/high voltage levels, representing two directions of motor rotation. In double-pulse mode (software configurable), this signal is counter-clock (CCW) pulse, active both at high level and low level. For reliable motion response, DIR signal should be ahead of PUL signal by 5μs at least. 4-5V when DIR-HIGH, 0-0.5V when DIR-LOW. Please note that rotation direction is also related to motor-driver wiring match. Exchanging the connection of two wires for a coil to the driver will reverse motion direction. The direction signal's polarity is software configurable.
4	DIR-	I	
5	ENA+	I	<u>Enable signal</u> : This signal is used for enabling/disabling the driver. In default, high level (NPN control signal) for enabling the driver and low level for disabling the driver. Usually left UNCONNECTED (ENABLED) . Please note that PNP and Differential control signals are on the contrary, namely Low level for enabling. The active level of ENA signal is software configurable.
6	ENA-	I	
7	ALM+	O	<u>Alarm Signal</u> : OC output signal, active when one of the following protection is activated: over-voltage, over current, short circuit and position following error. This port can sink or source 20mA current at 24V. In default, the resistance between ALM+ and ALM- is low impedance in normal operation and become high when HBS57 goes into error. The active level of alarm signal is software configurable. See Hybrid servo software operational manual for more detail.
8	ALM-	O	

Encoder Feedback Connector – DSub15 Female			
Pin	Name	I/O	Description
1	EA+	I	Encoder channel A+ input
2	EB+	I	Encoder channel B+ input
3	EGD	GND	Signal ground
4	HW	I	Reserved
5	HU	I	Reserved
6	FG	GND	Ground terminal for shielded
7	EZ+	I	Reserved
8	EZ-	I	Reserved
9	HV	I	Reserved
10	NC	-	Not Connected
11	EA-	I	Encoder channel A- input
12	EB-	I	Encoder channel B- input
13	VCC	O	+5V @ 100 mA max.
14	NC	-	Not Connected
15	NC	-	Not Connected

Power and Motor Connector- Screw Terminal			
Pin	Name	I/O	Description
1	U	O	Motor Phase U
2	V	O	Motor Phase V-
3	W	O	Motor Phase W
4	+Vdc	I	Power Supply Input (Positive) 20-45VDC recommended, leaving rooms for voltage fluctuation and back-EMF.
5	GND	GND	Power Ground (Negative)

Typical Connection

Typical Connection

Mechanical Specifications (unit: mm [inch])

Matching Motor Specifications:

HBS57 can work with the following Leadshine three phase hybrid stepper motors with encoder as follows:

	573S09-EC-1000	573S20-EC-1000
Step Angle (Degree)	1.2	1.2
Holding Torque (N.m)	0.9	2.0
Phase Current (A)	5.8	5.8
Phase Resistance (Ohm)	0.35	0.62
Phase Inductance (mH)	0.72	1.85
Inertia (g.cm ²)	280	580
Weight (Kg)	0.75	1.3
Encoder (lines / Rev.)	1000	1000
